Installation

All Operating Systems

1. Install Java 21+, e.g. OpenJDK 21.
    - You can check the Java version you have installed by running `java -version` in Terminal (Linux / macOS) or Command Prompt (Windows). See How to Check if Java is Installed.
2. Install Miniconda with Python version 3.x.
    - **[Windows]** During installation, enable the "Add Anaconda to my PATH environment variable" option. See Install Python on Windows

    - You can check the Conda version you have installed by running `conda --version` in Terminal (Linux / macOS) or Command Prompt (Windows). See Managing conda.

Linux

1. Run the included `install.sh` script. See How to run .sh in Linux.
    - Open a Terminal window (Ctrl+Alt+T).
    - Run `cd <install-directory>`, replacing **<install-directory>** with the complete path to the

installation directory.

- Run `chmod +x ./install.sh`.
- Run `./install.sh`.

2. Start JupyterLab
   - Run `cd <notebook-directory>`, replacing <**notebook-directory**> with the complete path to the root directory for your notebooks.
   - Run `jupyter lab`.
   - JupyterLab will start in a browser window.

macOS

1. Run the included `install.sh` script.
   - Open a Terminal window. See How to Open a Terminal Window in Mac.
   - Run `cd <install-directory>`, replacing <**install-directory**> with the complete path to the installation directory.
   - Run `chmod +x ./install.sh`. See Make a file executable in Terminal on Mac.
   - Run `./install.sh`.
2. Start JupyterLab
   - Run `cd <notebook-directory>`, replacing <**notebook-directory**> with the complete path to the root directory for your notebooks.
   - Run `jupyter lab`.
   - JupyterLab will start in a browser window.

Windows

1. Run the included `install.bat` script.
   - Double click `install.bat` from File Explorer. See How to run a batch file on Windows 10.
   - Alternatively use Run or Command Prompt. See How to Run a Batch File from the Command Line on Windows.
2. Start JupyterLab
   - Open Command Prompt.
   - Run `cd <notebook-directory>`, replacing <**notebook-directory**> with the complete path to the root directory for your notebooks.
   - Run `jupyter lab`.
   - JupyterLab will start in a browser window.
